Wireless connection support

Student Support | IT-KB-118

Identify the connection problem

Record whether the device cannot find a wireless network, cannot complete sign-in, or connects without reaching the service you need. These are different symptoms and should be described separately.

Check the device

Confirm that wireless networking is enabled and airplane mode is off. If a managed network profile is already installed on the device, use that profile rather than accepting an unexpected network name or sign-in prompt.

After a password change

A device may continue using a previously saved password. Review its saved connection settings before retrying. Do not copy a password into a support request.

Compare the symptoms

Check whether the same problem affects another service or another device. Note whether it happens in one location or several. This helps distinguish a device issue from a wider connectivity problem.

Open a support request

When you can reach the support portal, use New ticket at /tickets/new/. Enter a Request summary of 120 characters or fewer, such as Wireless connection fails after password change.

Keep the ticket number

Use Your tickets at /tickets/ to review the saved request and status. The support record tracks the request; it does not itself change the device network configuration.
