Account access support

Student Support | IT-KB-104

Request account access help

If you cannot sign in to an account, create a support request using New ticket at /tickets/new/. Enter a short Request summary describing the access problem, then select Create ticket.

Before you begin

Check the account name, the sign-in error and whether the problem started after a password change. If you can still sign in to the support portal, use that session to create the request.

Write a useful request summary

Keep the summary to 120 characters or fewer. Describe one issue at a time. For example: Unable to sign in after changing my password. Avoid adding unrelated account or billing questions to the same summary.

Keep credentials out of the request

Do not put a password, verification code or recovery code in the ticket title. Support staff can begin investigating an access problem from the service name and the displayed error.

After submitting

The portal opens the ticket record after creation. Note the ticket number and review the saved Request summary. The request starts with an Open status.

What a submitted request means

An Open ticket records that help has been requested. Creating the ticket does not change a password or restore account access. Check the affected service separately before considering the issue resolved.

Account access support - continued

Student Support | IT-KB-104

Before you begin

Use the same signed-in account that created the request. Open Your tickets at /tickets/ and select the relevant ticket number.

Track the request

The ticket page shows the saved summary and current status. Refer to the ticket number when discussing the issue with support. Avoid creating duplicate tickets simply because the original request is still open.

If the problem changes

If a different service fails or a new error appears, create a separate request with a summary that identifies the new issue. Keep the original ticket number for reference.

Close a resolved request

Once the issue no longer needs attention, open the ticket and select Close ticket. Review the confirmation and select Yes, close ticket, or Keep it open if you still need help.

Check the outcome

After confirming closure, read the saved status on the ticket page. A Closed status records closure of the support request; it does not establish whether a separate account or service is currently working.

Information to retain

Keep the ticket number, the service affected and the error you observed. A support record should identify the problem without storing credentials or verification codes.
